

# Acxiom DS API April 2022 Release

---

## Composite Endpoint Replacing Match

A new Composite Match Endpoint is taking the place of the Match Endpoint. Documentation on the Composite Match Endpoint is now available [here](#). The Composite Endpoint is an API that allows users to input a single record and is capable of returning data from multiple document types (e.g., person, place, entity, household, residency) in one response. Composite requests can be submitted as a single record or as a batch of records, each using a JSON POST request. The Composite Match Endpoint only returns attributes as defined in a user bundle.

## Heads Up!

Coming in the May 2022 DS API release we will be removing the word "match" from the Composite Endpoint URLs.

### Examples

#### **SINGLE REQUEST ENDPOINT (Transactional/Real-Time)**

POST `https://api.acxiom.com/composite/match` → `https://api.acxiom.com/composite`

#### **BATCH REQUEST ENDPOINT**

POST `https://api.acxiom.com/batch/composite/match` → `https://api.acxiom.com/batch/composite`
