

Acxiom DS API November 2022 Release

In the November 2022 DS API release, we added a new **clientReference** field to the Composite Endpoint.

The **clientReference** field is an optional field that allows you to pass through any string value, up to 256 characters, composed of letters (upper or lower), numbers (0-9), and special characters _ : . , # - (underscore, colon, period, comma, hash, or dash) in a request. If passed in through the request, this value will also be returned in the response in the corresponding results. If it is not present on the input it will not be present in the output.
